## ■ APPLICATION INFORMATION

### ◆ Detail Description

The STL6342 is a low quiescent current LDO linear regulator. The device provides preset 1.8V, 2.5V and 3.3V output voltages for output current up to 350mA. Other mask options for special output voltages from 1.2V to 5.0V with 100mV increment are also available (but only 1.28V in stead of 1.3V). As illustrated in function block diagram, it consists of a 1.23V reference, error amplifier, a P-channel pass transistor, an ON/OFF control logic, and an internal feedback voltage divider.

The 1.23V bandgap reference is connected to the error amplifier, which compares this reference with the feedback voltage and amplifies the voltage difference. If the feedback voltage is lower than the reference voltage, the pass-transistor gate is pulled lower, which allows more current to pass to the output pin and increases the output voltage. If the feedback voltage is too high, the pass-transistor gate is pulled up to decrease the output voltage.

The output voltage is feedback through an internal resistive divider connected to V<sub>OUT</sub> pin. Additional blocks include with output current limiter and shutdown logic.

### ◆ Internal P-channel Pass Transistor

The STL6342 features a P-channel MOSFET pass transistor. Unlike similar designs using PNP pass transistors, P-channel MOSFETs require no base drive, which reduces quiescent current. PNP-based regulators also waste considerable current in dropout conditions when the pass transistor saturates, and use high base-drive currents under large loads. The STL6342 does not suffer from these problems and consumes only 2.0μA (Typical) of current consumption under light loads.

### ◆ Enable Function

EN pin starts and stops the regulator. When the EN pin is switched to the power off level, the operation of all internal circuit stops, the build-in P-channel MOSFET output transistor between pins V<sub>IN</sub> and V<sub>OUT</sub> is switched off, allowing current consumption to be drastically reduced. The V<sub>OUT</sub> pin enters the GND level due to the several MΩ resistance of the feedback voltage divider between V<sub>OUT</sub> and GND pins.

### ◆ Output Voltage Selection

The STL6342 output voltage is preset at an internally trimmed voltage 1.8V, 2.5V or 3.3V. The output voltage also can be mask-optioned from 1.2V to 5.0V with 100mV increment by special order (but

only 1.28V in stead of 1.3V). The first two digits of part number suffix identify the output voltage (see *Ordering Information*). For example, STL6342-33 has a preset 3.3V output voltage.

### ◆ Current Limit

The STL6342 also includes a fold back current limiter. It monitors and controls the pass-transistor's gate voltage, estimates the output current, and limits the output current within 350mA.

### ◆ Thermal Overload Protection

Thermal overload protection limits total power dissipation in the STL6342. When the junction temperature exceeds T<sub>J</sub> = +155°C, a thermal sensor turns off the pass transistor, allowing the IC to cool down. The thermal sensor turns the pass transistor active again after the junction temperature cools down by 10°C, resulting in a pulsed output during continuous thermal overload conditions.

Thermal overload protection is designed to protect the STL6342 in the event of fault conditions. For continuous operation, the maximum operating junction temperature rating of T<sub>J</sub>=+125°C should not be exceeded.

### ◆ Dropout Voltage

A regulator's minimum input-output voltage differential, or dropout voltage, determines the lowest usable supply voltage. In battery-powered systems, this will determine the useful end-of-life battery voltage. The STL6342 uses a P-channel MOSFET pass transistor, its dropout voltage is a function of drain-to-source on-resistance (R<sub>DS(ON)</sub>) multiplied by the load current.

$$V_{\text{DROPOUT}} = V_{\text{IN}} - V_{\text{OUT}} = R_{\text{DS(ON)}} \times I_{\text{OUT}}$$
